

*Woodlands*

*Name two animals and insects that are mostly found in the woodlands habitat*

- 
- *Two types of animals that are found in the woodlands are voles and great horned owls.*
  - *Two types of insects that are found in the woodlands are the honey bee and the firefly.*

# *What types of trees and plants can grow in the woodlands?*

- *The types of trees that grow in the woodlands are the Walnut tree, the Hemlock tree, the Birch tree, the Maple tree, and the Oak tree.*
- *The types of plants they have in the woodlands are skunk cabbage and poison ivy.*

# *How is light an important factor in the growth of the woodlands?*

- *Where the light hits the ground can make a variety of different plants throughout the woodlands.*
- *Also with light in the woodlands we can grow more trees within the woodlands.*

# *How is tree spacing determined in woodland?*

- *If a tree is not spaced correctly then it won't have enough space to grow therefore it will not grow to the healthy height it needs and may slouch over so it is bent. This is unhealthy for the tree's development. It's a competition between the seedlings to see who can get the four components they need - light being one of the components*

# *Why are woodlands important to the environment?*

- The woodlands are important for the environment because the woodlands is the place where the animals such as deer live because they are hidden in the covered grounds with the tree trunks. Also the woodlands supply food such as berries for animals, and keep the animals healthy with the food.*
